NeuroAge Brain Age Report

Assessment name: kakashi hatake

Generated: 2026-10-30T05:03:18.001811+00:00

Field	Value
Assessment name	kakashi hatake
Chronological age	46.0 years
Predicted brain age	55.5 years
Brain age difference	9.5 years
Model name	NeuroAge-ResNet3D-18
Model version	kaggle-ixi-2026-10

Result summary

This report summarizes the model estimate for the MRI assessment. It provides an exploratory estimate of brain age and should be interpreted as research-oriented output rather than a medical diagnosis.

Key limitations

• This estimate is exploratory and not a medical diagnosis.

• The model was evaluated on a single IXI cohort and may not generalize across scanners or populations.

Health tips

Personalization level: Focused routine (difference over 5 to 10 years). Brain-age difference used: 9.5 years.

These general wellness ideas and meal examples are educational, not medical advice. The brain-age difference is a model estimate and does not determine nutritional needs. Adapt meal ideas for allergies, dietary needs, and clinician advice.

Screen time: Plan screen-free breaks during the day and stop recreational screen use about 1 hour before bed.

Sleep cycle: Keep wake time consistent, wind down before bed, and allow 7-9 hours for sleep each night.

Nutrition plan (vegetarian): Meal-prep plan: breakfast, overnight oats with fruit and seeds; lunch, lentil and vegetable grain bowl; dinner, tofu or chickpeas with vegetables and whole grains.

Nutrition plan (non-vegetarian): Meal-prep plan: breakfast, boiled eggs with fruit and whole-grain toast; lunch, prepared fish or chicken with vegetables and whole grains; dinner, bean and vegetable soup with an egg if desired.

Exercise: Put moderate activity on the calendar across the week; gradually work toward 150 minutes weekly and strength activity on 2 days.

Meditation: Aim for at least 10 minutes daily of mindfulness, meditation, or slow breathing.
